Group: AMEX

Reinforcement	Improvement
I love the idea and the post screen	The maroon was a different color. It is very dark
I like how your design mockups look. Your app looks great for where we are at.	It would be cool to add more pages to get some more depth to the app.
I like the app idea, I know I would use it if it was real.	I wish the icons and text on the home screen had better contrast with the background - maybe make them white?
Your idea is very creative and it could actually be a fun app for this campus.	The drafts had more empty space so stuff wasn't so cramped.
I really like their idea and I think they are making it come true. I like their feed screen.	They said they had more plans to add more pages and I totally think they should.
I like your team design layout -looks really good. I like the color as well.	I wish that the color was a little lighter, it feels too dark. Also, on your android studio screen layouts - try to leave space between the FEED and POST buttons. Right now, it looks too close to each other.
I like that the app is very practical, I could see myself using it	I wish that there was more details on things that went well
Unique idea, I think that DS could benefit from these app's features. Also, good color scheme.	It would be cool if you could see posts from previous days. Or at least have the option.
It's a good premise that could be very helpful for any student or teacher that wants to grab a quick bite	Potentially consider having more things to do in the app, while it does its job, it also just seems like something you could do just as easily as a Twitter or Facebook account.
I like the color scheme	It would be cool if there was a way to have people vote on stuff they like and give the feedback to concordia
project idea is amazing.	slides gave more image context of the product
I like that you have a dislike button.	I wish you could look at previous days.

Your screen flow logic is well organized. You guys already have a systematized path of how different screens will follow one another and its distinctively good! Your Icons also look great, not sketchy or things like that. This will give the user a great feel while navigating through your app. The like and dislike button functionality is particularly intriguing, I can't wait to see your final implementation of it! Other functionalities that you have like adding profile picture and being able to delete account are fantastic too! Your background is great too. The pinkish color is closer to cobber color palette. I like that color agreement.	I think you've got a lot off functionality in settings that you'll probably need to break to other pages. Think archives, so you can always go ahead fast by being able to look back easily.
The pitch for your app, it's similar to my group and so it'll be fun to see how both of ours develop (creating food app for concordia)	It would be cool if you could have a qna section so that dining service workers could reply to questions students and faculty have.
The colors match Concordia's colors. The possbility to see if the food is something I would eat would be a very useful tool, cause they don't always have things updated or things are different from what they say they are.	I would have liked to see more on the demo.
	If there would be a way to see tomorrow's menu as well so you can plan ahead of time
They mapped out the flow of their application. The mockup showcased the color scheme and some of the flow	If we could see more screens and a little more functionality
Great Mockups	You guys added a little more details on the mockups - like the diagram version of it.
I like the idea of creating something specifically for students on campus to use. It's another unique way for people to connect.	I wish we could have heard more about potential ideas for other features/screens. It would be cool if there could be pages of highly/poorly rated food items and popular reviews.

Unclear	Alternatives
Why are all the settings are buttons?	Creating a post screen Making the feed change depending on DS schedule not daily?
I'm unsure about how people are going post on the feed.	Have you considered to have notifications so people can quickly know what is on the menu.
Will there be an image (like a photo) on the home page? I think that would look good. How does the user log out and get to the settings from the feed page? If the buttons are there, you can ignore this because I just didn't see them.	Have you considered where the post button will take the user compared to the feed page? As it is right now, It looks like they both lead to the feed. Could the feed page just be the home page?
Would this have an account creation system so that users are able to post these reviews? or is it anonymous so there's no sign in.	Copying concordia's styling like using a white background with maroon and gold accents.
Nothing really I think everything makes sense it is just the design that I am thinking about.	The pages look a bit crowded I would like it everything was more spaced out or even doing like a hamburger menu type of thing for the account settings.
Nothing	Have you considered coming up with a team logo or app logo?
I'm unsure about their plan going forward	have you considered adding more screens
Can you explain more about the posts users will make? Are there any guardrails to monitor what users post?	Adding more pages? It seems like you have less than the required pages.
Why would you exactly need a login page? I thought the program was centered around a group of people posting reviews, or can anyone with the app leave reviews?	Again going back to my other question, why makes this different than just making a Twitter or Facebook account? What makes it stand out or be unique?
im unsure about how will you get the menu will it just get updated as soon and Concordia posts the daily menu or will you have a collab with them to get that ahead of time	having an option for people to talk about the maize too
Do you get the actual menu from the cobbernet website or is it only based on what other people post?	change the background color. the black icons blend into the maroon too much
How does dark mode work if the background is maroon instead of black?	Have you considered content moderation? Technically, it's a social media app.

What is the actual purpose of your app? This aspect didn't quite ring our clearly.	I think you all are on a great path with regards to your functionalities and wish you all the best!
I'm unsure if your app is just for reviews or has more components?	Have you considered changing the name so students know it's a review app.
Are we going to receive notifications via email or just the app?	Nothing to add right now
How are you going to try to get students to participate in the app?	Keeping a past archive of what was served to attempt to see if they will serve something again soon, or what people thought of it the last time it was served
-	A settings slider instead of a page
Your process so far	More functionality?
I'm unsure if user accounts will be linked to students or if they can be random/anonymous.	I think the idea for the feed being updated every day to keep it recent, but it would also be nice for people to have a place to look back on past posts.
